Review

Supplementary processes for material removal... such as electric discharge machining, electrochemical machining, ultrasonic machining, laser beam machining, and nanomachining have been in service for several decades. However, despite the extensive use of these processes, several questions remain unanswered. This book represents a fresh attempt to provide the long-overdue answers to some of these research questions. Its 12 chapters present the contributions of 24 of the best-qualified minds of eight countries. The first three chapters cover the basics of machining, with the remainder of the book focusing on newer techniques. Anyone with a research interest in the field of material removal will find this a valuable resource and a worthy addition to their professional and personal libraries... Recommended.

Machining is one of the most important manufacturing processes. Parts manufactured by others processes often require further operations before the product is ready for application. Machining is the broad term used to describe the removal of material from a work-piece. Machining processes can be applied to work metallic and non-metallic materials such as polymers, wood, ceramics and composites.

Machining: Fundamentals and Recent Advances is divided into two parts. The first part explains the fundamentals of machining, with special emphasis on three important aspects: mechanics of machining, tools, and work-piece integrity. The second part is dedicated to recent advances in machining, including: machining of hard materials, machining of metal matrix composites, drilling polymeric matrix composites, ecological machining (using the minimal quantity of lubrication), high-speed machining (sculptured surfaces), grinding technology and new grinding wheels, micro- and nano-machining, non-traditional machining processes, and intelligent machining (computational methods and optimization).

Professional engineers, researchers and advanced students interested or involved in modern manufacturing

engineering will find *Machining: Fundamentals and Recent Advances* an invaluable reference.

First ever book which shows the complete up to date summary of the most resource consuming field of manufacturing sector. Though book is compiled from large number of research articles, but the editors of individual chapters has taken enough care to make it more interesting. Finally the book editor Dr.J.P.Davim, his contribution to the field of manufacturing will be remembered for long.
